Executive Summary

1 High-Level Overview

OVERVIEW	
Project Name	Batch Defect
Project Type	Frontend
Total Test Cases	13
Base URL	https://batch-defect-prediction.streamlit.app/
Pass / Fail / Blocked	Frontend: 13 Passed / 0 Failed

2 Key Findings

Test Summary

The frontend suite looks strong: 13 of 13 executable user-journey tests passed, with no failures or blocked cases. That gives a 100% success rate on the executable subset, so the score is computed from the frontend tests only and no blocked tests need to be discounted. The results suggest the key product flows are stable: CSV upload, guided usage, demo-data switching, help access, and anomaly-analysis journeys all behaved as expected. Overall, the app appears reliable for the tested end-to-end paths and the user experience is consistent across the major entry points.

What could be better

There are no surfaced failures in this run, so there are no concrete defects to chase from the test data. The main limitation is coverage breadth rather than correctness: the suite validates the primary upload/demo/help flows, but it does not expose edge-case validation, error states, or deeper anomaly-analysis interactions. Because every checked journey passed, any remaining risk is likely in untested branches rather than in the core UI. If you want higher confidence, add tests for invalid CSVs, empty states, network errors, and state persistence across refresh or navigation.

Recommendations

Keep the current flows green, then expand coverage into the failure and edge-case paths that this run did not exercise. Add tests for malformed CSV upload, missing columns, empty demo-data handling, slow-loading states, and recovery after switching between upload and demo data. Also consider assertions around result content, not just navigation and help panels, so anomaly-analysis output is validated more deeply. Since nothing failed here, the most productive move is to broaden the suite and re-run it after each incremental change to confirm the current upload/demo/help journeys stay stable.

Frontend UI Test Results

1 Test Coverage Summary

This report summarizes the frontend UI testing results for the application. TestSprite's AI agent automatically generated and executed tests based on the UI structure, user interaction flows, and visual components. The tests aimed to validate core functionalities, visual correctness, and responsiveness across different states.

CATEGORY	TEST CASES	PASS/FAIL RATE
Anomaly Detection Analysis	3	3 Pass / 0 Fail
Usage Guidance	3	3 Pass / 0 Fail
Data Upload & Source Selection	4	4 Pass / 0 Fail
Demo Dataset Flow	3	3 Pass / 0 Fail

Note

The test cases were generated using real-time analysis of the application's UI hierarchy and user flows. Some visual and functional validations were adapted dynamically based on runtime DOM changes.

2 Test Execution Summary

TEST CASE	TEST DESCRIPTION	IMPACT	STATUS
Anomaly Detection Analysis			
Upload a manufacturing CSV for anomaly analysis	Validates that a user can upload a process-parameter CSV and reach the anomaly detection results view.	High	PASSED
Open the usage help for the dashboard	Validates that a user can expand the help content and view instructions for using the anomaly detection dashboard.	Low	PASSED
Use demo data to view anomaly results	Validates that a user can switch to demo data and see anomaly detection output without uploading a file.	High	PASSED
Usage Guidance			
Upload a CSV using guided instructions	Verify a user can follow the dashboard guidance to upload a CSV and proceed to analysis.	High	PASSED
Use demo data from guidance	Verify the dashboard guidance supports switching to demo data and viewing the analysis flow without uploading a file.	Medium	PASSED
Open dashboard help guidance	Verify the dashboard help panel can be opened to explain how to use the app.	High	PASSED
Data Upload & Source Selection			
Keep upload source selected while preparing a file	Verify a user can choose the upload source, open the uploader, and complete file selection for analysis.	Low	PASSED
Upload a manufacturing CSV for analysis	Verify a user can choose the upload source and successfully upload a manufacturing process CSV for analysis.	High	PASSED
Use demo data instead of uploading a file	Verify a user can switch to demo data and continue into the analysis experience without uploading a CSV.	High	PASSED
View the dashboard help before uploading	Verify a user can open the help section and then proceed to upload a dataset.	Medium	PASSED
Demo Dataset Flow			
Open demo data help and continue analysis	Validates that a user can review the dashboard help content while using demo data and still reach the sample analysis results.	Low	PASSED
Use demo data for anomaly analysis	Validates that selecting the built-in demo dataset loads the manufacturing anomaly analysis results without uploading a CSV.	High	PASSED
Switch from upload to demo data flow	Validates that a user can switch the data source from CSV upload to built-in demo data and continue to the sample analysis output.	Medium	PASSED
